                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention provides nucleotides encoding molecular variants of the human multi drug resistance-1 (MDR-1) protein. These can be used to identify compounds capable of treating multidrug resistance and sensitivity interfering resulting from polymorphisms in MDR-1, which can lead to difficulties in treating cancer, cardiovascular, neuronal, inflammatory and CNS diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New polynucleotide encoding a molecular variant Multi Drug Resistance (MDR)-1 polypeptide is useful for diagnosing and treating diseases associated with abnormal MDR-1 expression or function, e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       WPI;

The present sequence is a modified oligonucleotide. 2'-O-acetamic modified nucleosides were used to produce oligonucleotides which enhanced nuclease resistance and superior hybridisation properties.

compounds

are

leotides which have ation properties that identification or 2'-0-acetamido-

The present invention relates to a method for the qualitative and quantitative detection of targets in a sample by molecular interact between the target and probes in an array. The method can be used detect interactions between nucleic acids, antigens and antibodien

receptor and ligands,

particularly

c acids, antigens in applications s

such

They have a modified nucleoside monomer and are specifically hybridisable with a preselected nucleotide sequence of a single-stranded or double-stranded target deoxyribonucleic acid or ribonucleic acid molecule. The oligomers are further useful in a ras-luciferase fusion system using ras-luciferase transactivation. They are useful in abnormal cell proliferation and tumour formation and modulation of expression of protein kinase C and cell adhesion molecules such as ICAM. They are useful in the modulation of proteins related to multidrug resistance and viral genomic nucleic acids such as HOV, herpes viruses, Epstein-Barr virus, cytomegalovirus, papillomavirus, hepatitis C virus and influenza
                                                                                                                                                                Bickel

                                                                         The present invention relates to methods for distinguishing between individuals homozygous for and therefore afflicted with Van Buchem's disease, individuals heterozygous for and therefore carriers of Van Buchem's disease and individuals who are not afflicted with Van Buchem's disease comprise identifying a large genomic deletion in chromosome 17 at 17q21. The method is useful for identifying individuals who are afflicted with or carriers of diseases associated with one or more genomic deletion, particularly Van Buchem's disease, which is a rare autosomal recessive disorder that results in a bone dysplasia referred to a craniotublar hypertosis. The present sequence is a PCR primer used to amplify 92Kb gene fragment in human chromosome 17 at 17q21
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 19 BP; 0

Alkylation of alcohols, amines, nucleosides that are precursors beneficial as therapeutics, invo nes, or thiols, useful for preparing sors for preparation of oligomeric compounds involves use of cyclic sulfate intermediates

Example 15; Col 35; 45pp; English.

C? The present sequence is that of a chimeric oligonucleotide having some 2' carethyl thioethyl modifications. This was compared with oligonucleotides (c) with methoxyethoxy (see ABA91950) and dimethylaminopropyl (see ABA91951) (c) modifications for resistance to snake venom phosphodiseterase. The assay revealed the nuclease resistance of the modified oligomers. The invention compartives by cyclic sulfate intermediates. In particular, methods for the alkylation of alcohols, amines, thiols and their contributives by cyclic sulfate intermediates. In particular, methods for the alkylation of the 2', 3' or 5'-hydroxy position of nucleosides and contribute the modified compounds are disclosed. Displacement of the 2', 3' or 5'-O-alkyl contribute modified compounds are disclosed. Displacement of the 2', 3' or 5'-O-sulfate with a nucleophile provides 2', 3' or 5'-O-modified contributes. The methods are especially useful for the preparation of 2'-O-alkyl nucleotides, nucleosides and nucleoside surrogates that are precursors for the preparation of oligomeric compounds useful as therapeutics, diagnostics and research reagents

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match
The present sequence is that of a chimeric oligonucleotide having some 2' -dimethylaminopropyl modifications. This was compared with oligonucleotides with methyl thioethyl (see ABA91949) and methoxyethoxy (see ABA91950) modifications for resistance to snake venom phosphodiesterase. The assay revealed the nuclease resistance of the modified oligomers. The invention provides methods for the alkylation of alcohols, amines, thiols and their derivatives by cyclic sulfate intermediates. In particular, methods for the alkylation of the 2', 3' or 5'-0-alkyl sulfate modified compounds are sulfates to form the 2', 3' or 5'-0-alkyl sulfate modified compounds are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Dimethylaminopropyl modified oligonucleotide
                                                                                                                                                                                                                                                                                                                     Alkylation of alcohols, amines, or thiols, useful for preparing nucleosides that are precursors for preparation of oligomeric compounds beneficial as therapeutics, involves use of cyclic sulfate intermediates

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ន្តន្តន្តន្តន្ត្
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       disclosed. Displacement of the 2', 3' or 5'-O-sulfate with a nucleophile provides 2', 3' or 5'-O-modified nucleosides and their analogues. The methods are especially useful for the preparation of 2'-O-alkyl nucleotides, nucleosides and nucleoside surrogates that are precursors for the preparation of oligomeric compounds useful as therapeutics,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence
                                                   Alkylation of alcohols, amines, or thiols, useful for preparing nucleosides that are precursors for preparation of oligomeric cobeneficial as therapeutics, involves use of cyclic sulfate interpretations.
                                                                                                                                                                                                                                                                                        modified_base

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ABA91951) modifications for resistance to snake venom phosphodiesterase. The assay revealed the nuclease resistance of the modified Oligomers. The invention provides methods for the alkylation of alcohols, amines, thiols and their derivatives by cyclic sulfate intermediates. In particular, methods for the alkylation of the 2', 3' or 5'-hydroxy position of nucleosides and their analogues with cyclic sulfates to form the 2', 3' or 5'-0-sulfate modified compounds are disclosed. Displacement of the 2', 3' or 5'-0-sulfate with a nucleophile provides 2', 3' or 5'-0-modified nucleosides and their analogues. The methods are especially useful for the preparation of 2'-0-alkyl nucleosides and nucleoside surrogates that are precursors for the preparation of oligomeric compounds useful as therapeutics, diagnostics and research
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 19
                                                                                             The invention relates to detecting mutations in the BRCA1 and hMLH1 gene comprising subjecting a set of amplification products to two-dimensional DNA electrophoresis (TGDS) to produce a characteristic spot pattern for specific mutation in either the BRCA1 or the hMLH1 gene. Also included are test kits for enabling BRCA1 or hMLH1 gene testing comprising short PCR primers given in the specification, mixed in 20 mM of Tris-HC1, 50 mM of CR1, 25 micro M of dNTP, and 5 % formande. The method is useful for KC1, 25 micro M of dNTP, and 5 % formande. The method is useful for
                                                                                                                                                                                                                                                                                                                                                                                                                               Detecting mutations in the BRCA1 and hMLH1 gene comprises subjecting amplification products to 2-dimensional gel electrophoresis to produce characteristic spot pattern for a specific mutation in either the BRCA1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            hMLH1; DNA mismatch repair; BRCA1; ss; PCR; primer; BRCA1; breast and ovarian cancer susceptibility gene; TGDS; human; two-dimensional DNA electrophoresis; tumour suppressor gene;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human MLH1 DNA mismatch repair gene,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    27-AUG-2002 (first entry)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ABK94423 standard; DNA; 19
   detecting mutations in the BRCA1 (breast and ovarian cancer susceptibility gene, a tumour suppressor gene) and hMLH1 gene (a DNA mismatch repair gene). The present sequence is a PCR primer specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                WPI; 2002-471507/50
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       06-NOV-2000; 2000WO-IB001607

     The present invention describes a method for detecting a nucleic acid probe, which comprises using chain extending enzymes to elongate probes. The method comprises: (a) treating the sample with a chain terminating reagent to prevent polynucleotide chain growth from the nucleic acid in the sample; (b) contacting the sample with the probe containing a terminus capable of elongation by a chain extending enzyme, where the probe hybridises to the nucleic acid in the sample; (c) contacting the sample with a chain extending enzyme and its substrates, which elongates the probe; and (d) detecting the elongated hybridised probe. Also described is a method comprising: (a) treating nucleic acid molecules or modified nucleic acids in a sample with a reagent or reagents that render the nucleic acid chains unextendable by a non-template-dependent enzyme; (b) hybridising the treated molecules with a nucleic acid probe that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 19

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              RESULT 1754
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ABA91970
            The present sequence is that of single nucleotide polymorphism (SNP)

C primer MPO-R. This primer was used in a multiplex endpoint SNP analysis

C as an example of the use of novel non-fluorescent asymmetric cyanide dye

c compounds of the invention as quenching reporter dyes. A 7-colour

C extension of the fluorogenic PCR 5'-nuclease, or Taqman, assay. The test

CS ystem was a set of 3 SNPs, denoted MPO, BAK and LIG. Each SNP system

CC consisted of 2 primers (see ABA91569-74) and 2 sequence-specific probes

CC consisted of 2 primers (see ABA91569-74) and 2 sequence-specific probes

CC consisted of 2 primers (see ABA91569-74) and 2 sequence-specific probes

CC consisted of 2 primers (see ABA91569-74) and 5 sequence-specific probes

CC consisted of 2 primers (see ABA91569-74) and 6 different reporter dyes (6-FAM,

CC nitrothiazole blue, at the 3' end, and 6 different reporter dyes (6-FAM,

CC nitrothiazole blue, at the 3' end, and 6 different reporter dyes (6-FAM,

CC nitrothiazole blue, at the 3' end, and 6 different reporter dyes (6-FAM,

CC nitrothiazole blue, at the 3' end, and 6 different reporter dyes (6-FAM,

CC nitrothiazole blue, at the 3' end, and 6 different reporter dyes (6-FAM,

CC nitrothiazole blue, at the 3' end, and 6 different reporter dyes (6-FAM,

CC nitrothiazole blue, at the 3' end, and 6 different reporter dyes (6-FAM,

CC nitrothiazole blue, at the 3' end, and 6 different reporter dyes (6-FAM,

CC nitrothiazole blue, at the 3' end, and 6 different reporter dyes (6-FAM,

CC nitrothiazole blue, at the 3' end, and 6 different reporter dyes (6-FAM,

CC nitrothiazole blue, at the 3' end, and 6 different reporter dyes (6-FAM,

CC nitrothiazole blue, at the 3' end, and 6 different reporter dyes (6-FAM,

CC nitrothiazole blue, at the 3' end, and 6 different reporter dyes (6-FAM,

CC distorning dyes (6-F
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

                                                The present invention relates to a novel method of selective alkylation of the 2' position of 2', 3'-dihydroxy sugar moieties of a nucleoside. The method involves dissolving the nucleoside in at least one aprotic solvent, cooling, treating with base, warming, cooling and reacting with a reactive ester. The method is useful for the preparation of 2'-O-alkyl nucleosides, nucleosides and nucleoside surrogates used for preparation of oligometric compounds having improved hybridisation affinity and nuclear resistance, which are useful as the appendice, diagnostics and nuclear resistance, which are useful as the appendice, diagnostics and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAD42000 standard;

                                                                                                            The present invention relates to a novel method of selective alkylation of the 2' position of 2', 3'-dihydroxy sugar moieties of a nucleoside. The method involves dissolving the nucleoside in at least one aprotic solvent, cooling, treating with base, warming, cooling and reacting with a reactive ester. The method is useful for the preparation of 2'-O-alkyl nucleotides, nucleosides and nucleoside surgates used for preparation of oligomeric compounds having improved hybridisation affinity and nuclear resistance, which are useful as therapeutics, diagnostics and research reagents. The present sequence is a modified oligonucleotide used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAD42002

The method involves dissolving the nucleoside in at least one aprotic solvent, cooling, treating with base, warming, cooling and reacting with a reactive ester. The method is useful for the preparation of 2'-O-alkyl nucleotides, nucleosides and nucleoside surrogates used for preparation of oligomeric compounds having improved hybridisation affinity and nuclear resistance, which are useful as therapeutics, diagnostics and research reagents. The present sequence is a modified oligonucleotide used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Alkylating 2' position of 2',3'-dihydroxy sugar moiety of nucleoside for preparation of 2'-O-alkylated compounds comprises dissolving nucleoside in aprotic solvent, cooling, treating with base, warming,

                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to a novel method of selective alkylation of the 2' position of 2', 3'-dihydroxy sugar moieties of a nucleoside. The method involves dissolving the nucleoside in at least one aprotic solvent, cooling, treating with base, warming, cooling and reacting with a reactive ester. The method is useful for the preparation of 2'-O-alkyl nucleotides, nucleosides and nucleoside surrogates used for preparation of oligomeric compounds having improved hybridisation affinity and nuclear resistance, which are useful as therapeutics, diagnostics and research reagents. The present sequence is a modified oligonucleotide used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Alkylating 2' position of 2',3'-dihydroxy sugar moiety of nucleoside used for preparation of 2'-O-alkylated compounds comprises dissolving nucleoside in aprotic solvent, cooling, treating with base, warming, cooling and reacting with ester.

The method involves dissolving the nucleoside in at least one aprotic solvent, cooling, treating with base, warming, cooling and reacting with a reactive ester. The method is useful for the preparation of 2'-O-alkyl nucleotides, nucleosides and nucleoside surrogates used for preparation of oligomeric compounds having improved hybridisation affinity and nuclear resistance, which are useful as therapeutics, diagnostics and research reagents. The present sequence is a modified oligonucleotide used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Alkylating 2' position of 2',3'-dihydroxy sugar moiety of nucleoside used for preparation of 2'-O-alkylated compounds comprises dissolving nucleoside in aprotic solvent, cooling, treating with base, warming, cooling and reacting with ester.

The method involves dissolving the nucleoside in at least one aprotic solvent, cooling, treating with base, warming, cooling and reacting with a reactive ester. The method is useful for the preparation of 2'-O-alkyl nucleotides, nucleosides and nucleoside surrogates used for preparation of oligomeric compounds having improved hybridisation affinity and nuclear resistance, which are useful as therapeutics, diagnostics and research reagents. The present sequence is a modified oligonucleotide used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Alkylating 2' position of 2',3'-dihydroxy sugar moiety of nucleoside for preparation of 2'-O-alkylated compounds comprises dissolving nucleoside in aprotic solvent, cooling, treating with base, warming, cooling and reacting with ester.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    08-JAN-1999;

```

The present invention relates to a novel method of selective alkylation of the 2' position of 2', 3'-dihydroxy sugar moieties of a nucleoside. The method involves dissolving the nucleoside in at least one aprotic solvent, cooling, treating with base, warming, cooling and reacting with a reactive ester. The method is useful for the preparation of 2'-O-alkyl nucleotides, nucleosides and nucleoside surrogates used for preparation of oligomeric compounds having improved hybridisation affinity and nuclear resistance, which are useful as therapeutics, diagnostics and research reagents. The present sequence is a modified oligonucleotide used to illustrate the method of the invention

Alkylating 2' position of 2',3'-dihydroxy sugar moiety of nucleoside used for preparation of 2'-O-alkylated compounds comprises dissolving nucleoside in aprotic solvent, cooling, treating with base, warming, cooling and reacting with ester.

Example 46; C01 33; 24pp; English.

The the present invention relates to a novel method of selective alkylation the 2' position of 2', 3'-dihydroxy sugar moieties of a nucleoside. method involves dissolving the nucleoside in at least one aprotic

The method is useful for the preparation of 2'-O-alkyl nucleotides, nucleosides and nucleoside surrogates used for preparation of oligomeric compounds having improved hybridisation affinity and nuclear resistance, which are useful as therapeutics, diagnostics and research reagents. The present sequence is a modified oligonucleotide used to illustrate the method of the invention

                                                                                                       Query Match
                                                                                                                                                                      The present invention relates to a novel method of selective alkylation of the 2' position of 2', 3'-dihydroxy sugar moieties of a nucleoside. The method involves dissolving the nucleoside in at least one aprotic solvent, cooling, treating with base, warming, cooling and reacting with a reactive ester. The method is useful for the preparation of 2'-O-alkyl nucleotides, nucleosides and nucleoside surrogates used for preparation of oligomeric compounds having improved hybridisation affinity and nuclear resistance, which are useful as therapeutics; diagnostics and research reagents. The present sequence is a modified oligonucleotide used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 04-NOV-2002

                                                                                                                                                                                                                             The present invention relates to a novel method of selective alkylation of the 2' position of 2', 3'-dihydroxy sugar moieties of a nucleoside. The method involves dissolving the nucleoside in at least one aprotic solvent, cooling, treating with base, warming, cooling and reacting with a reactive ester. The method is useful for the preparation of 2'-O-alkyl nucleotides, nucleosides and nucleoside surrogates used for preparation of oligomeric compounds having improved hybridisation affinity and nuclear resistance, which are useful as therapeutics, diagnostics and research reagents. The present sequence is a modified oligonucleotide used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                        Alkylating 2' position of 2',3'-dihydroxy sugar moiety of nucleoside used for preparation of 2'-O-alkylated compounds comprises dissolving nucleoside in aprotic solvent, cooling, treating with base, warming, cooling and reacting with ester.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Kawasaki AM,

Alkylating 2' position of 2',3'-dihydroxy sugar moiety of nucleoside used for preparation of 2'-0-alkylated compounds comprises dissolving nucleoside in aprotic solvent, cooling, treating with base, warming, cooling and reacting with ester.

Example 46; Col 35; 24pp; English.

The present invention relates to a novel method of selective alkylation of the 2' position of 2', 3'-dihydroxy sugar moieties of a nucleoside. The method involves dissolving the nucleoside in at least one aprotic solvent, cooling, treating with base, warming, cooling and reacting with a reactive ester: The method is useful for the preparation of 2'-O-alkyl nucleotides, nucleosides and nucleoside surrogates used for preparation of oligomeric compounds having improved hybridisation affinity and nuclear resistance, which are useful as therapeutics, diagnostics and research reagents. The present sequence is a modified oligonucleotide used to illustrate the method of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           RESULT 1768
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         derivative for the preparation of a pharmaceutical composition for cancer, or malignant glioma in a subject having a genome with a variant callele which comprises a cytochrome p450, subfamily IIIA (nifedipine cytostatic activity. The therapeutic applications of (I) is improved, since it is possible to individually treat a subject with an appropriate dosage and/or an appropriate derivative of (I). Therefore, undesirable, harmful or toxic effects are efficiently avoided. Unnecessary and cytostatically harmful treatment of those subjects who do not respond to the treatment with substances (nonresponders), as well as the development of the CACF67751 and ABM34912 to ABM35013 represent sequences used in the cycentrical control of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes the use of irinotecan (I) or its compositive for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject having a genome with a variant callele which comprises a cytochrome p450, subfamily IIIA (nifedipine coxidase), polypeptide 5 (CYP3A5) polypuclectide (II). (I) and (II) have cytostatic activity. The therapeutic applications of (I) is improved, comparated to individually treat a subject with an appropriate comparated exivative of (I). Therefore, undesirable, compared to the comparated exivative of (I). Therefore, undesirable, compared to the comparated exivative of (I) are fore, undesirable, compared to the compared to the comparated exivative of (I) are fore to the comparated exivative of (I) are fore to the comparated exivative of (I) are fore to a subject who do not respond to the comparated to subspace (I) as the development of comparated with substances (nonresponders), as well as the development of comparated to subspace the comparated of the substances due to subspace and comparated of the comparated of the present invention of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes a method for the use of irinotecan (I) cits derivative for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject having a genome with a variant allele which comprises a multidrug resistance protein 1 (MRP1) polynucleotide (II). (I) has cytostatic activity. (I) or its derivative can be used for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject, where the subject is a human (preferably African or Asian) or a mouse. The present sequence represent a sequence which is used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      variant allele comprising polynucleotide.
cancer, or war-s-allele which comprises
                                                                                                                                                                                                                                                       Use of irinotecan or its derivative for composition for treating cancer in a substant allele comprising a multidrug polynucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              irinotecan; colorectal cancer; cervical cancer; gastric cancer;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 19 BP; 1 A;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Disclosure;
     The present invention describes a method for the use of irinotecan (I) or its derivative for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject having a genome with a variant allele which comprises a multidrug resistance protein 1 (MRP1) polynucleotide (II). (I) has cytostatic activity. (I) or its derivative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       23-JUL-2001;

The present sequence represents a sequence which is used in the exemplification of the present invention.
                                            Increasing binding of oligomeric compound to proteins useful preparation of antisense therapeutics, involves use of modificaligomeric compound having oligonucleotide group.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 19

In examples of the invention, 2'-O-MTE was incorporated into oligonucleotides and evaluated for antisense properties in comparison with the known 2'-O-(2-methoxyethyl) (2'-O-MOE) modification. The 2'-O-MTE modified oligonucleotides exhibited similar binding affinity to target RNA as their 2'-O-MOE equivalent while binding to human serum albumin was improved. The modification can be used to modulate the pharmacokinetics of oligonucleotides, e.g. in antisense

                                                                                                                                                                                                                                              CC hypotensive, dermatological anorectic, immunosuppressive, cytostatic, contidiabetic, antiinfertility, haemostatic, antiinfammatory, anti-HTV, cc antiasthmatic, metabolic, immunomodulator, neuroprotective, notropic, antiparkinsonian and antilipaemic activities, and can be used in gene ct therapy. NoVX proteins are useful for treating or preventing a pathology consisted with the human disease. NoVX nucleic acide, proteins and can be used in the treatment and diagnosis of cardiomyopathy, catherosciated with the human disease. NoVX nucleic acide, proteins and can be used in the treatment and diagnosis of cardiomyopathy, catherosciated with the human disease. NoVX nucleic acide, proteins and consisted exists the protein and diagnosis of cardiomyopathy, catherosciated with the human disease. NoVX nucleic acide, proteins and consists, hypertension, congenital heart defects, acrtic stenosis, congenital hypertensis, scleroderma, obesity, transplantation, congenital adrenal hyperplasia, prostate cancer, diabetes, metabolic congenital adrenal hyperplasia, prostate cancer, fertility, haemophilia, hypercoagulation, idiopathic thrombocytopenic purpura, graft versus host confectious disease, anorexia, cancer-associated eachexia, cancer, confectious disease, parkinson's disease, immune disorders, cancer, consective, disease, parkinson's disease, immune disorders, cancer, consective, disease, anorexia, cancer associated eachexia, cancer, consective, which are used in examples from the present invention with any consecuted in examples from the present invention with

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to the novel use of irinotecan to treat a patient suffering from cancer. This involves determining if the patient has one or more variant alleles of the UGTIA1 gene, and if the patient has one o more of such variant alleles, irinotecan is administered in an increased or decreased amount in comparison to the amount that is administered without regard to the patient's alleles in the UGTIA1 gene. The invention has cytostatic activity. A composition of the invention acts as a topoisomerase I inhibitor. The method is useful for treating a patient, an animal e.g. mouse or a human, perferably African or Asian, suffering from cancer such as colorectal, cervical, gastric cancer, lung, ovariant, pancreatic cancer or malignant glioma. The present sequence is udes in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ovarian

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to the novel use of irinotecan to treat a patient suffering from cancer. This involves determining if the patient has one or more variant alleles of the UGTIA1 gene, and if the patient has one or more of such variant alleles, irinotecan is administered in an increased or decreased amount in comparison to the amount that is administered without regard to the patient's alleles in the UGTIA1 gene. The invention has cytostatic activity. A composition of the invention acts as a topoisomerase I inhibitor. The method is useful for treating a patient, an animal e.g. mouse or a human, preferably African or Asian, suffering from cancer such as colorectal, cervical, gastric cancer, lung, ovarian, pancreatic cancer or malignant glioma. The present sequence is udes in the concertification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Use of irinotecan to treat cancer patient by determining if patient variant alleles of UGT1A1 gene, administering increased/decreased among irinotecan based on increased/decreased levels of UGT1A1 gene pro
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     23-JUL-2001; 2001EP-00117608

The invention relates to the novel use of irinotecan or its derivative for the preparation of pharmaceutical compositions for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject having a genome with a variant allele whice comprises a multidrug resistance 1 (MDR1) polynucleotide. A composition of the invention has cytostatic activity. The invention is useful for the preparation of pharmaceutical compositions for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject having a genome with a variant allele which comprises a multidrug resistance 1 (MDR1) polynucleotide. A composition of the invention has cytostatic activity. The invention is useful for the preparation of pharmaceutical compositions for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject (preferably human, more preferably African or Asian) or a mouse. The present sequence is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ror the preparation

The invention relates to an isolated nucleic acid (NI) comprising at CC least 20 but not more than 1500 consecutive nucleotides of the optineurin CC promoter appearing as ADE13890. Also included are the optineurin promoter operably linked to a heterologous nucleic acid, a nucleic acid capable of detecting a single nucleotide polymorphism (SNP) in the optineurin promoter promoter, a host cell comprising the promoter operably linked to a compression of the optineurin grounds are cell or bodily fluid (comprising detecting a polymorphism complements), detecting a SNP sequence variation in a sample containing DNA, detecting a SNP sequence variation in a sample containing DNA, detecting the presence of an optineurin promoter sequence variation compression of glaucoma or to a progressive ocular hypertensive consecutivitility to glaucoma or to a progressive ocular hypertensive consecutivity of progression of visual field in a patient (or the severity or progression of glaucoma in a patient, comprising providing amplification reaction primers that direct amplification of a selected containing the variation within the optineurin comprising providing a sample containing human genomic DNA, providing a nucleic acid capable of detecting a SNP located within an optineurin promoter, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New nucleic acid sequences of the optineurin gene are useful to polymorphisms particularly single nucleotide polymorphisms in the optineurin promoter to diagnose, prognose and treat glaucoma and prognose 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            06-MAR-2002; 2002US-00091281
                                                                                                                                                                                                                                                                                                                   detecting the polymorphism). The invention is used to diagnose and prognose glaucoma and also to treat glaucoma related disorders. The present sequence is an optineurin promoter motif, repeat element of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               WPI; 2003-864168/80

The compounds are useful for therapeutic and investigative purposes and for treating hepatitis C virus infection. The compounds having 2'-O-modifications increases their affinity and nuclease resistance. This sequence represents an oligomeric compound of the

                                                                                                          This invention relates to novel synthetically modified oligomers that have increased nuclease resistance and have enhanced hybrid binding. So oligomers are useful for diagnostic and therapeutic uses such as antisense technologies. The invention also discloses a method for the preparation of the oligomers with modifications as fully defined in the specification. The present sequence represents a synthetically modification oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           purposes and for treating having 2'-O-modifications resistance. This sequence invention.

                                                                                                                                                                                                                                                                This invention relates to novel synthetically modified oligomers that have increased nuclease resistance and have enhanced hybrid binding. Sucoligomers are useful for diagnostic and therapeutic uses such as antisense technologies. The invention also discloses a method for the preparation of the oligomers with modifications as fully defined in the specification. The present sequence represents a synthetically modified oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             07-JUL-1999;

The invention also discloses a method for the preparation of the oligomers with modifications as fully defined in specification. The present sequence represents a synthetically modifical oligonucleotide of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                       RESULT 1786
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel pharmaceutical composition, which has a confirmation for the strike agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an cantiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung suffectant in a subject, for respiratory to be prophylaction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of cyunctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory, steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine of lung surfactant in a subject's tissue, or treating bronchoconstriction, lung surfactant in a subject is sue, or respiratory disease or condition.

Note: The sequence data for this patent is not represented in the printed specification, but was obtained not segmences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Best
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches

A composition of the invention cc antiinflammatory, antiallergic, antiasthmatic, hypotensive, acc use in antisense gene therapy. The composition is useful for treating or cc preventing a respiratory, lung or malignant disease or condition, also cc antiinflammatory steroid in a subject, for reducing or depleting levels of an antisinflammatory steroid in a subject, for reducing or depleting levels of of or reducing sensitivity to adenosine, reducing levels of adenosine creceptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject, s tissue, or treating bronchoconstriction, cc lung surfactant in a subject, or the sequence or condition. CC lung inflammation, lung allergies, or a respiratory disease or condition. CC specification, but was obtained in electronic format directly from WIPO ca tftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention describes a method of selecting genetic markers as targets for nucleic acid sequence amplification comprising selecting each of the genetic markers according to a heterozygosity index of 0.5 or greater. Selecting and amplification of genetic markers are useful as targets for nucleic acid sequence amplification, for genetic testing or facilitating multiplex PCR amplification from limiting amounts of target nucleic acid. The methods are also useful for improving genetic diagnostic and screening methods, such as prenatal diagnostic testing, foetal sex determination or genetic identification, e.g. DNA profiling or DNA fingerprinting. The nucleic acid sequence amplification is also useful in forensic analysis of degraded, old, ancient and difficult samples that are difficult to amplify and identify. This sequence represents a PCR primer used in the selection and amplification of genetic markers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             usersuling genetic markers as targets for nucleic acid sequence amplification, useful for improving genetic testing, e.g. fetal sex determination, comprises selecting each of the genetic markers according to a heterozygosity index.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         WPI; 2003-381725/36.

Determining the ethnic origin of a male by obtaining a nucleic acid sample from the male and identifying at least two polymorphic markethe nucleic acid sample indicative of the ethnic origin of the male

ä

Claim 24; Page 57; 74pp; English.

The invention describes a method of determining the ethnic origin of a comprising obtaining a nucleic acid sample from the male, and condition at least two polymorphic markers in the nucleic acid sample conditative of the ethnic origin of the male, using at least one primer conditions are primer pairs given in the specification. Also described is a method of: identifying polymorphic sites in a nucleic acid; a kit for continuous the ethnic origin of an individual; determining the ethnic origin of an individual; determining the ethnic continuous bases including at continuous bases including at condition; and conditions of a human factor amplifying polymorphic regions of the Y chromosome comprisions at least 10 contiguous bases including at cold primer pairs for amplifying polymorphic regions of the Y chromosome given in the specification; nucleic acid primer pairs for amplifying polymorphic regions of the Y chromosome condition. The method is useful for determining the ethnic origin of a condition. The method is useful for determining the ethnic origin of a condition of a primer used to detect polymorphisms in the non-recombining region of the human Y chromosome (NRY).

 gene.
```

```
The invention relates to short interfering nucleic acids (siNA) which CC downregulate expression of the human interleukin-2 gene by RNA CC interference. The siNAs may or may not comprise ribonucleotides and may CC interference. The siNAs may or may not comprise ribonucleotides and may CC be double or single stranded. They further comprise sense and antisense CC regions, or alternatively are assembled from a sense oligonucleotide and interfering RNA (siRNA, double-stranded RNA, micro-RNA (miRNA) and short CC interfering RNA (siRNA, double-stranded RNA, micro-RNA (miRNA) modified, CC can contain deoxyribonucleotides, and can be chemically synthesised, CC expressed from a vector or enzymatically synthesised. The invention also crelates to kits for the in vitro or in vivo delivery of siRNA; conjugates CC and/or complexes of siRNA; and vectors that express siNA. The siNAs are CC used to modulate expression of the interleukin-2 gene in cells, tissue CC explants or organisms (e.g., by ex vivo gene therapy), or in grafts and CC transplants for the treatment of a variety of conditions. They may be CC used for treating cancer, restenses and polycystic kidney disease. The cientification and validation, genetic engineering, pharmacogenomics, containing gene function, and gene mapping (e.g., of single nucleotide CC polymorphisms). The present sequence represents the upper strand of a human interleukin-2-targeted double-stranded siNA, which is identical to the interleukin-2-targeted double-stranded siNA, which is identical to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Example 3; SEQ ID NO 116; 138pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          downregulate expression of the human interleukin-2 gene by RNA
Chiterference. The siNAs may or may not comprise ribonucleotides and may
ceed be double or single stranded. They further comprise sense and antisense
ceed regions, or alternatively are assembled from a sense oligonucleotide and
can antisense oligonucleotide. Specifically, the siNAs include short
interfering RNA (siRNA, double-stranded RNA, micro-RNA (miRNA) and short
ceed interfering RNA (siRNA, double-stranded RNA, micro-RNA (miRNA) and short
ceed can contain deoxyribonucleotides, and can be chemically synthesised,
cexpressed from a vector or enzymatically synthesised. The invention also
cexpressed from a vector or enzymatically synthesised. The invention also
cexpressed from a vector or enzymatically synthesised. The invention also
cexpressed from a vector or enzymatically synthesised. The invention also
cexpressed from a vector or in vivo delivery of siRNA; conjugates
and/or complexes of siRNA; and vectors that express siNA. The siNAs are
cused to modulate expression of the interleukin-2 gene in cells, tissue
explants or organisms (e.g., by ex vivo gene therapy), or in grafts and
cransplants for the treatment of a variety of conditions. They may be
cused for treating cancer, restenosis and polycystic kidney disease. The
classification and validation, genetic engineering, pharmacogenomics,
studying gene function, and gene mapping (e.g., or single nucleotide
polymorphisms). The present sequence represents the upper strand of a
the interleukin-2-targeted double-stranded siNA, which is identical to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

regions, or alternatively are assembled from a sense oligonucleotide and annisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA, double-stranded RNA, micro-RNA (miRNA) and short can contain deoxyribonucleotides, and can be chemically synthesised, can contain deoxyribonucleotides, and can be chemically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siRNA; conjugates and/or complexes of siRNA, and vectors that express siNA. The siNAs are caplants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating cancer, restenosis and polycystic kidney disease. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the lower strand of a contain the contains and substrained as a contain the contains and substrained siNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 05-SEP-2002;

```
cc be double or single stranded. They further comprise sense and antisense cc regions, or alternatively are assembled from a sense oligonucleotide and cc an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA, double-stranded RNA, micro-RNA (miRNA) and short can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised. Cc can contain deoxyribonucleotides, and can be chemically synthesised, crelates to kits for the in vitro or in vivo delivery of siRNA; conjugates co wised to modulate expression of the interleukin-2 gene in cells, tissue cx explants or organisms (e.g., by ex vivo gene therapy), or in grafts and creating cancer, restenosis and polycystic kidney disease. The cused for treating cancer, restenosis and polycystic kidney disease. The calls are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the lower strand of a human interleukin-2-transed Annabaservanda sina

C expression of a target polypeptide associated with lung airway or lung construction or cancer and can be anti-sense to the corresponding mRNA.

C The invention also describes a kit, that comprises: (a) a delivery constitution also describes a kit, that comprises: (a) a delivery constitution and also describes a kit, that comprises: (a) a delivery constitution for adding a carrier and for use of the kit. The composition confirmed and cytostatic activity, is a sense to analyze in hypotensive, immunosuppressive and cytostatic activity, is a constitution accomprises oligo and is administered to reduce the production corrected the amount of target polypeptide present in the lungs. The composition comprises oligo and is administered to reduce the production corrected the amount of target polypeptide present in the lungs. The complanary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction.

CC expression of a target polypeptide associated with lung airway or lung conversion of a target polypeptide associated with lung airway or lung conversion or cancer and can be anti-sense to the corresponding mRNA. CC The invention also describes a kit, that comprises: (a) a delivery. CC device, in separate containers, (b) the oligonuclectides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The CC reduce the amount of target polypeptide present in the lungs. The CC inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, cc inflammation, allergies, asthma, impeded respiration, respiratory CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonary brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to,it

                                                                                                                                                               The invention describes an oligonucleotide comprising several nucleotides covalently linked together by internucleotide linkages. At least one of the nucleotides is linked to an adjacent nucleotide by 2',5',5', internucleotide linkage and bears a 3'-substituent. The oligonucleotides are useful; as antisense oligonucleotides, in pharmaceutical compositions; for treating organism that utilises RNA-DNA transcription or RNA-protein translation, bacteria, yeast, protozoa, algae and warm-blooded animals; for developing diagnostic and therapeutic agents. The modified oligonucleotide exhibits improved properties of nuclease resistance and hinding affinity. The oligonucleotides are easy to synthesise and exhibit good properties of nuclease resistance and hybridisation to target nucleic acids. The oligonucleotide is potent antisense agent with longer duration of action. This sequence represents an oligonucleotide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                 New oligonucleotide comprising at least one 2',5'-internucleotide useful for treating organisms having disease caused by undesired
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ADG28485

                                                                                                                                                                                              The present invention relates to novel oligonucleotides comprising several nucleotide units which are specifically hybridisable with a selected sequence of RNA or DNA wherein at least one of the nucleotide moieties of the oligomer is modified to include a guandinium group. These oligonucleotides are useful for diagnostic, therapeutic and investigative purposes. The present sequence is an oligonucleotide used in the exemplification of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                        selected sequence of RNA or DNA wherein at least one of the nucleotide moieties of the oligomer is modified to include a guanidinium group. These oligonucleotides are useful for diagnostic, therapeutic and investigative purposes. The present sequence is an oligonucleotide used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New oligomers containing expression by hybridizing nucleic acids.
